

Task 1: Collection

- Aim:
 - Create a **large test collection** that can be made publicly available
- Method:
 - Extract **queries and relevance assessments** (included and excluded studies) from existing systematic reviews

Task 1: Collection

- Result:
 - Collection of **150 topics** from systematic reviews (93 annotated with clinical labels — PICO)
 - 51 Medline, 99 PubMed Queries (different QLs)
- One other collection has since been made available (TAR 2017):
 - **Not as representative** of systematic reviews (it only contains reviews about diagnostic test accuracy)
 - **is smaller** (50 topics, combination of Medline & PubMed QLs)
